

JustHR — KPI Structure

Revised understanding, validated against the Head HR KPI template

1. KPI Catalog (Definition Stage)

The KPI catalog is a three-level hierarchy. Nothing here is tied to an employee yet — this is just the library of KPIs that exist.

PERSPECTIVE (Category)

↳ GOAL (Parent KPI)

↳ INDICATOR (Child KPI)

- **PERSPECTIVE** — the top-level category. Examples from the client's sheet: Financial, Customer/Stakeholder Management, Process, People, and now Core Values.
- **GOAL** — a parent KPI sitting under a perspective. A perspective can have several goals under it. Special case: under the **Core Values** perspective, each value (Transparency, Integrity, Performance, "Get it fast") is its own goal — they are not grouped under one shared goal.
- **INDICATOR** — the actual measurable child KPI under a goal. This is the line item that eventually gets scored.

Note: TIMELINE is not part of the catalog. An indicator in the catalog has no timeline attached — see Section 3.

2. Weight Rules

- Every **PERSPECTIVE (category)** has a weight, and all perspective weights together must sum to **exactly 100**. Example: Financial = 30, Customer/Stakeholder = 25, Process = 25, People = 15, Core Values = 5 → totals 100.
- Within a perspective, the **INDICATOR** weights are entered by the client on their own point scale (whole numbers, not fractions), and the running total of indicators in that category **cannot exceed the category's cap**. Example: if Financial = 30, its indicators might be weighted 4, 5, 4, 7, 4, 2, 4 — summing to no more than 30.
- **Backend conversion:** the client never enters or sees decimals/percentages. Internally, store each indicator's weighted percentage as:

```
indicator_weighted_percentage = indicator_points / 100
```

This works cleanly because category caps already sum to 100 across the whole KPI set, so an indicator's raw points are already "out of 100" globally.

Validation to build

1. Block saving/publishing a KPI set unless perspective weights sum to exactly 100.
2. Block adding/editing an indicator's weight if it would push its category's running total above that category's cap.

3. KPI Assignment Stage

This is separate from the catalog. Assignment is where a **TIMELINE** gets attached to an indicator.

- **TIMELINE** (Annually, Quarterly, Monthly, Daily, Bi-Annually, As required, etc.) is chosen at the point of **assigning** an indicator — not when defining it in the catalog.
- The same indicator can be assigned to different people/groups with different timelines (e.g. assigned Quarterly to one department, Monthly to another).
- The timeline chosen at assignment determines what period options appear later on the **Measurement** screen (e.g. Quarterly → Q1-Q4 selection; Monthly → Jan-Dec; Daily → date picker).

Assignment Scope Levels

An indicator can be assigned at any of four scope levels:

- 1. **Individual** — assigned directly to one employee
- 2. **Department** — assigned to everyone in a department
- 3. **Job Grade** — assigned to everyone at a grade level
- 4. **Job Step** — assigned to a specific step within a grade (finer-grained than grade alone)

When scored, department/grade/step assignments resolve out to the individual employees who fall under that scope at the time.

Open item (not yet decided): if an employee ends up with the same indicator through more than one scope (e.g. an individual assignment *and* a department assignment), the resolution rule (override, both apply, or block duplicate) still needs to be defined before build.

4. Measure (Deferred)

- **MEASURE** is the descriptive scoring rubric/criteria text that explains what each score value means for an indicator (e.g. "Within Budget = 2, Savings 5–10% = 3...").
- The client currently tracks this externally and does not need it stored in-system for v1.
- Recommendation: leave it out of the v1 build, but keep the field open as an optional/deferred addition — it would help with score consistency and dispute resolution (e.g. in the Balance Call review flow) if added later.

5. Summary Table

Field	Set at	Notes
Perspective (Category)	Catalog	Weight caps sum to 100
Goal (Parent KPI)	Catalog	Multiple per perspective; Core Values = 1 goal per value
Indicator (Child KPI)	Catalog	Weight in points, capped by category
Weight	Catalog	Client enters points; system stores points/100 as backend %
Timeline	Assignment	Not part of catalog; drives Measurement periods
Scope (Individual/Dept/Grade/Step)	Assignment	Determines which employees the indicator applies to
Measure	—	Deferred for v1; client tracks externally
